OVERVIEW

Rubber chips provide a modern, cushioned surface in your arena to relieve stress on horse joints. Spreading a layer of rubber chips on your arena surface improves drainage, performance, and comfort while reducing dust, compaction, and fatigue. Rubber chips offer more cushion than hard-packed arena surfaces which reduces compression stress on equine leg joints. Rubber granules resist compaction better than sand or dirt. See our website for additional information on how we can improve your footing.Arena & Related - Const|Repair|Acc.>Arena Footing
